Propose to adopt `make_array` into the IS

Proposal

This paper proposes to adopt the “Array creation functions” [1] in Library Fundamentals v2 into the C++ working paper, for the following reasons:

1. These facilities are useful, and have been replicated/reinvented in many places/codebases, also been an LWG issue since 2008 [2], while the design adopted in TSv2 is of the least controversial among those.
2. The functionality is stable since the initial `make_array` paper [3].

Wording

The wording is relative to N4594.

Copy the section 9.2.2 [container.array.creation] [1] from Library Fundamentals v2 to the IS working paper, as a new section 23.3.7.9 [array.creation] between [array.zero] and [array.tuple], and adjust 23.3.2 [array.syn] accordingly (see the adopted paper [4] for reference).

Amend the examples in 23.3.7.9 with the following:

[Example:

```
int i = 1; int& ri = i;
auto a1 = make_array(i, ri);           // a1 is of type array<int, 2>
auto a2 = make_array(i, ri, 42L);      // a2 is of type array<long, 3>
auto a3 = make_array<long>(i, ri);     // a3 is of type array<long, 2>
auto a4 = make_array<long>();          // a4 is of type array<long, 0>
auto a5 = make_array();                // ill-formed
auto a6 = make_array<double>(1, 2);    // ill-formed: might narrow
```

–end example]
