P0615R0: Renaming for structured bindings

As per EWG guidance on Monday, this paper replaces the term "decomposition declaration" with "structured binding declaration" and adds the term "structured binding" for each name so introduced.

Change in 7 [dcl.dcl] paragraph 8:

A *simple-declaration* with an *identifier-list* is called a ~~decomposition~~ **structured binding** declaration (8.5 [dcl.decomp]).

Change in 7.1.7.2 [dcl.type.simple] paragraph 4:

For an expression *e*, the type denoted by `decltype(e)` is defined as follows:

- if *e* is an unparenthesized *id-expression* naming ~~an lvalue or reference introduced from the identifier-list of a decomposition declaration~~ **a structured binding (8.5 [dcl.decomp])**, `decltype(e)` is the referenced type as given in the specification of the ~~decomposition~~ **structured binding** declaration (8.5 [dcl.decomp]);
- ...

Change in 7.1.7.4 [dcl.spec.auto] paragraph 1:

The auto *type-specifier* is also used to introduce a ~~decomposition~~ **structured binding** declaration (8.5 [dcl.decomp]).

Change the section heading and paragraph 1 of 8.5 [dcl.decomp]:

8.5 ~~Decomposition~~ **Structured binding** declarations [dcl.decomp] [dcl.struct.bind]

A ~~decomposition~~ **structured binding** declaration introduces the identifiers *v0*, *v1*, *v2*, ... of the *identifier-list* as names (3.3.1), **called structured bindings**. ... where the declaration is never interpreted as a function declaration and the parts of the declaration other than the *declarator-id* are taken from the corresponding ~~decomposition~~ **structured binding** declaration. ...

Change in 14.6.2.2 [temp.dep.expr] paragraph 3:

An *id-expression* is type-dependent if it contains

- ...
- an *identifier* associated by name lookup with a ~~decomposition~~ **structured binding** declaration (8.5) whose *brace-or-equal-initializer* is type-dependent,
- ...

Change in Annex B [implimits]:

- ...
- ~~Identifiers~~ **Structured bindings** introduced in one ~~decomposition~~ declaration [256].
- ...
