Identifying Module Source

P0713R0 argued for requiring a leading syntactic marker to distinguish *module units* from traditional translation units that are not module units. Discussion in Toronto concluded with a vote that supported that direction (strongly favor: 3, favor: 18, neutral: 14, against: 3, strongly against: 0) after the publication of the modules TS (now N4720). This paper proposes wording specifically for implementing the leading marker as the strawman proposal in P0713R0:

```
module;  
...  
export module X;  
...
```

Changes to N4720

Change the definition of *translation-unit* in paragraph 6.5/1 [basic.link] to:

```
translation-unit:  
    declaration-seqopt  
    module-unitopt  
  
module-unit:  
    single-module-unit  
    mixed-module-unit  
  
single-module-unit:  
    module-declaration declaration-seqopt  
  
mixed-module-unit:  
    module ; declaration-seqopt single-module-unit
```

and remove the definitions of *oplevel-declaration-seq* and *oplevel-declaration*.

In [dcl.module.unit] 10.7.1 paragraph 1, delete one sentence as follows:

1. A module unit is a translation unit that contains a module-declaration. A named module is the collection of module units with the same module-name. ~~A translation unit shall not contain more than one module-declaration.~~ A module-name has external linkage but cannot be found by name lookup.
