### 1 Proposed Wording

#### References

Informative References

The filesystem library lives in `std::filesystem`. This makes usage excessively verbose and ergonomically challenging.

It is common practice for people to introduce the namespace alias `namespace fs = std::filesystem;` when using the filesystem library to make usage more concise.

[cppreference.com's examples](#) for the filesystem library use either `using namespace boost::filesystem;` or `namespace fs = std::filesystem;`.

[Boost Filesystem's tutorial and examples](#) use `namespace fs = boost::filesystem;`.

## § 1. Proposed Wording

The proposed changes are relative to ISO/IEC JTC1/SC22/WG21 [\[N4727\]](#), the working draft of the C++ International Standard as of the 2018-02 mailing.

Add the following to the header synopsis for `<filesystem>` in 30.11.5 [**fs.filesystem.syn**]:

```
namespace std { namespace fs = filesystem; }
```
