Table of Contents

The filesystem library lives in `std::filesystem`. This makes usage verbose and ergonomically challenging.

It is common practice for people to introduce the namespace alias `namespace fs = std::filesystem;` when using the filesystem library to make usage more concise.

[cppreference.com's examples](#) for the filesystem library use either using `namespace std::filesystem;` or `namespace fs = std::filesystem;`.

[Boost Filesystem's tutorial and examples](#) use `namespace fs = boost::filesystem;`.

Let's standardize this.

Wording: Add the following to the header synopsis for <filesystem> in [\[fs.filesystem.syn\]](#):

```
namespace std { namespace fs = filesystem; }
```
