§ 1. Revision History

This paper is the initial revision.

§ 2. Introduction

The proposal for concurrent queues *C++ Concurrent Queues (P0260)* uses an enumeration to specify possible return states of some queue operations. This enumeration is called `conqueue_errc` as it was originally meant for exceptions. However, the concurrent queue proposal doesn't propose it's own exception class anymore, so the name is misleading.

§ 3. Name Options

In initial revisions of P0260 the enumeration was called `queue_op_state`. But `op_state` has a specific meaning in S/R context that completely different.

Dropping the `op` gives us `queue_state`. To make it clear that it's specific to concurrent queues we could also name it `conqueue_state`.

§ 4. Proposal 1

Rename `std::conqueue_errc` to `std::queue_state`.

§ 5. Proposal 2

Rename `std::conqueue_errc` to `std::conqueue_state`.
