[1 Introduction](#)

[2 Wording](#)

[3 References](#)

§ 1 Introduction

This paper provides replacement wording for the following papers:

- [\[P3940R0\]](#): Rename concept tags for C++26: `sender_t` to `sender_tag`
- [\[P4031R1\]](#): Rename `system_context_replaceability` namespace

This resolves the following national body comment on the C++26 CD:

- [US 205-320](#)

and partially addresses the following national body comment on the C++26 CD:

- [RO 4-395](#)

Because there are multiple papers in flight targeting 33 [\[exec\]](#), LWG requested replacement wording for renames to minimize merge conflicts.

§ 2 Wording

Instructions to the editor:

After applying *all other papers* moved during the Croydon meeting, please make the following replacements in 33 [\[exec\]](#):

- Replace each instance of `sender_t` with `sender_tag`.
- Replace each instance of `scheduler_t` with `scheduler_tag`.
- Replace each instance of `operation_state_t` with `operation_state_tag`.
- Replace each instance of `system_context_replaceability` with `parallel_scheduler_replacement`.
- Replace each instance of `sysctxrepl` in a stable name with `parschedrepl`.
- Replace each instance of `receiver_t` **outside** `[exec.continues.on]`¹ with `receiver_tag`.
- In `[exec.continues.on]`, replace `using receiver_concept = receiver_t;` with `using receiver_concept = receiver_tag;`.
